MARTIN DANIELSON

Consultant. Available from 15 March, 2020

A humble engineer with 20+ years of experience in computer science and proud pioneer of *React* (back in 2014).

Looking for an interesting position where my experience can help new ideas grow and my people skills can help build a great culture.

Maintaining a good balance between my love for anything tech, a real connection to the product and surrounding myself with passionate people is what I believe to be the key to success; and has proven to make for excellent results.

I live in Stockholm and spend my spare time travelling and enjoying life with my family.

EXPERIENCES

Front end engineer

Aftonbladet

Rekindling my passion for engineering I have had the great pleasure to build features for a site used by over 3 million users per day. Resting on top of a modern tech stack built on *React* & *Redux*, hosted in the cloud (AWS) and powered by continuous integration; we have pushed features on a daily basis with great success.

Adding on top of this responsibilities for product features (tracking), the recruitment process and experiencing one of the best feedback cultures and teams I have ever been part of I have grown immensely as both an engineer and human being.

Solution architect

SEB

Wanting to evolve from my stagnating role as an engineer I took a leap of faith and quickly found myself being the chief architect for the *WebSphere Portal* & *WCM* product. Following this up with a role as project lead, with a team of 9 engineers; I take great pride in being the driving force behind one of very few successful implementations at that time.

I closed out my journey at *SEB* as a solution architect introducing modern web technologies on the front end platform of the *Internet bank*.

CTO & COO

Lokalen Game Host

Built & operated game hosting services for corporate markets (*Bredbandsbolaget*, *Webhallen*)

.NET engineer

SEB Kort

Deployed several credit card micro websites based on a common platform that towards the end also incorporated early SPA concepts. Partly in Denmark.

Java engineer

SEB

As part of the company wide transformation to a more enterprise architecture; transitioned to *Java* enterprise engineer, building the new corporate cash management system. Partly in Germany.

Student

Thorlidsplan's Gymnasium

Graduated with honors from the *Natural Science* program (Math & Engineering).

2020

Schibsted

Full stack engineer

Schibsted acquired *Aftonbladet* 2017 and much of the experience still held true in this role. What *Schibsted* brought to the table was the challenging task to turn a single site to several multinational news destinations, all powered by the same tech stack. Heavy focus on reuse of course, while at the same time maintaining full performance and stability. Shifted focus towards our API which meant a lot more *Node.js* development.

Organizational challenges have also taught me to work cross teams both domestic and international. And I also attained the roles as tester and dev ops.

2017

2016

Quinyx

Tech lead & Agile coach

Supported a team of excellent engineers to adopt *React* in its early stages of development. Building the foundation for the next generation platform.

Also coached two teams of engineers to grow, build trust and feel safe at work.

2014

2011

Rocket Blast AB

CEO

Founded and built my own game hosting company.

2010

SEB

Senior Java engineer

Developed my skills as an engineer while also building the foundation of my proficiency in working with, and as part of, different teams; drawing from *Agile* techniques such as *Scrum*, *Lean* & *Kanban*; but also processes such as *RUP* and *Waterfall*.

Built and designed a rich client for wealth management and a business process management tool based on *WebSphere Application Server*.

2006

2004

2003

SEB

Solution architect

Led a project to hand over the aforementioned foreign exchange tool to a London based company. Partly in England.

2002

2001

SEB

Microsoft engineer

Quickly rose from junior to senior engineer taking on a leading role for several projects, including rebuilding *SEB's* public websites from the ground up - across multiple countries. Partly in Norway.

Revolutionized foreign exchange trading accuracy between large financial institutions and built several business critical internal tools.
